

The Ultimate Shift Engine

Roster, pay and skills for shift workers whose roster isn't a week.

Files

File	What it is
<code>index.html</code>	The whole app — no build step, no dependencies
<code>manifest.webmanifest</code>	Makes it installable to a phone home screen
<code>sw.js</code>	Service worker — caches the app so it opens without signal
<code>icon-192.png</code> / <code>icon-512.png</code>	Home screen icons

All five files must sit in the same folder.

Putting it online

1. Sign in to github.com and create a new repository — name it `shift-engine` , set it **Public**, tick **Add a README**.
2. On the repo page, click **Add file → Upload files**.
3. Drag all five files in. Scroll down, click **Commit changes**.
4. Go to **Settings → Pages**.
5. Under *Build and deployment*, set **Source** to `Deploy from a branch` , **Branch** to `main` , folder `/ (root)` . Click **Save**.
6. Wait two or three minutes. The URL appears at the top of that page:
`https://YOURNAME.github.io/shift-engine/`

Installing it on a phone

iPhone — open the URL in Safari (must be Safari), tap the Share button, scroll to **Add to**

Home Screen, tap Add.

Android — open the URL in Chrome, tap the three dots, tap **Install app** or **Add to Home screen**.

It then opens full screen with its own icon and works without signal.

Updating it later

Edit or re-upload `index.html` in GitHub, commit, and the live site updates in a minute or two.

If a change doesn't show up on a phone that already has it installed, bump the cache name in `sw.js` — change `shift-engine-v1` to `shift-engine-v2` . That forces every installed copy to pull the new version.

Data

Everything is stored on the device using browser local storage. Nothing is uploaded and there is no account. Clearing the browser's site data, or deleting the installed app, wipes it.

Not yet built

- Reading paystips out of email
- Photographing a printed roster to set the pattern
- Sharing the roster with family
- Backing settings up so a new phone can restore them
